Part 2- Tech takes over

The point is more than clear ain't it? Artificial intelligence is a real deal and it will surely take over. That is a bold statement to make as

of now, but 20 years down the line, we would feel how obvious it should've been to us. If you haven't yet noticed at least some effects of artificial intelligence around you, there's a possibility that you're lying. Yup, no other possibility.

It's funny...how we just don't realize the seriousness of the change that we're living through. From hunter-gatherers to farmers, from farmers to factory workers, from factory workers to what we are now, what's after this that awaits us?

When computers came into being, a mass fear of losing work, similar to what we witness today, prevailed for a long time. But what was the result? Computers created exponentially more jobs than they

took away. Is something similar going to happen now? Are we transitioning into something we don't see yet?

As of now, there still lies some fear among the masses. But perhaps that's how it's supposed to be, every time there occurs a prominent change and the new takes over the old. Perhaps, what we feel now, is what our ancestors felt in the 1960s and 1740s. The thing is, we don't know for sure what might happen in the future. But read that line again. Isn't that common sense ?

This may sound like false optimism that seeks to soothe the fear of the future, but one may also look at it as the good'ol act of "ACCEPTING FATE".

It was bound to happen, human intelligence was bound to take on

itself at some or the other point of time. That time isn't here yet, but it's inevitable. What we can do is prevent it from happening for a while. What will be the requirements?

Well..you can't harness a stallion without knowing how to get atop.
