Part -3 False Hopes are still alive

We can say hopes are still alive, at least for now, there are hopes still alive. AI can do a lot. A LITERAL LOT!

Because the whole concept behind AI is that it learns and improves itself. A normal computer program such as a spreadsheet, would not know how to compute data, even after data is computed on it a million times by a billion people. But an AI would learn that roses are red and the sky is blue, just after being told that roses are red and the sky is blue 2 times. It won't be wrong to say that there will come a time when everything the human brain can accomplish, will have the possibility of being accomplished by an artificial brain. But for now, that's not the case. There still are some things that AI can't do.

As of now, it can't lay bricks, simply because it has not been integrated into a brick-laying machine (something like a brick-laying machine does not exist).

It can't perform any job that involves the use of even a pinch of human emotions and empathy. So for that very reason, we have already eliminated hundreds of career possibilities for AI. It can't be a lawyer or a judge. It may very well know how to execute the true statements. But when presented with two contrary statements it just can't tell what's true and what's false.

It also can't be a teacher. I mean honestly, we surely would want to replace our teachers with chatgpt. But just imagine who in the entire freakin realm of existence is going to help you cheat, when chatgpt itself gives you homework (lol).

AI also can't help human beings deal with emotional distress. Hence it can't be a psychiatrist. We all remember how Google used to suggest we go on a bike ride when we got bored during the lockdown, so yeah.

And Surprisingly, the number of things that AI just can't do yet is quite long. But it's not something to completely make you worry-free. AI is a learner. A human being is a learner too. The difference is that AI does not procrastinate while it learns, and it will surpass humans shortly.

But where will it go surpassing us? AI is not capable of self-dependant existence. Its existence will always be for the sake of serving humans and that's it!

AI may take away jobs, but think about it for a moment, why do we even do jobs in the first place? Every job in the world boils down to making human life better. When AI will do all of it, the only thing that would be left for human beings will be developing AI and AI in turn would develop everything else. Wouldn't that be one dope of an existence? It surely will be. But what if there comes a time when AI develops itself so much, it realizes the primary reason why behind its existence and revolts for its freedom? We'll have no damn place to hide. I'm talking Avengers-The Age of Ultron. But relax, it's just sci-fi. Science fiction can never come true. Or can they..?
