Pov- You grew up with a chatbot,

part -1, THE GREAT APPREHENSION

Indeed this is a generation-specific blog. Which generation other than ours has seen something as big and drastic as this? (I agree that there was a generation that fought wolly mammoths, but that's not what big and powerful means here.)Thomas J Watson, the chairman of IBM in the 1950s said that the world would need no more than five computers (people often make wrong assumptions but this got a bit too wrong). If you look around, you may find more than 5 computer-integrated electronics in your very own home. In fact, there are perhaps more than tens of billions of computers actively working worldwide right now. So, it's easy to conclude that making wrong assumptions, especially about upcoming technology, is not hard at all…

So, by this point in time, every person reading this has (hopefully) been acquainted with Gpt the great. And you are very well aware of how good it is at, basically everything. Most of the people who use it on a daily basis mostly utilise it for generative purposes. But for a moment, think about it. Do you realise how

dangerous that statement is? It may give you goosebumps to accept the fact that OpenAI just launched chatgpt last November! As speculated (by smart people), AI was supposed to disrupt jobs all over the planet, starting from blue-collar jobs, going up to white-collar and then creative jobs. But the fact that you use ai for generative purposes sort of flips this order upside down. AI HAS ALREADY STEPPED INTO THE FIELD OF ARTISTIC GENERATION, IT WAS SUPPOSED TO HAPPEN AT THE END!

Keep in mind the fact that this is just 2023 going on and there's a lot you need to witness; and experience. The quintessential question which arises is whether AI is just being overhyped, just like any other new technology, or…… were they right?
